

Scene 08: global fidelity and subtle red-wall recovery are different objectives

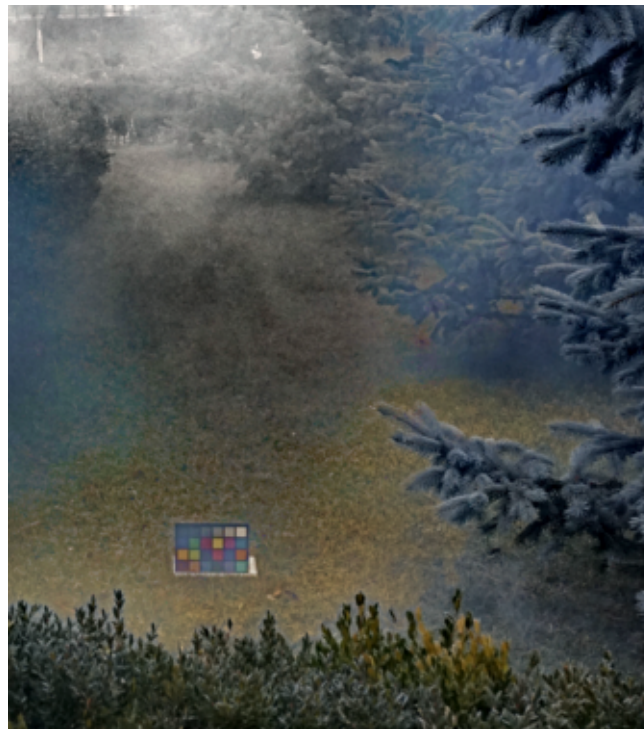

Hazy input

CAR default

CAR globally tuned

Ground truth

wall $a^* = -0.45$

wall $a^* = 1.81$

wall $a^* = -0.03$

wall $a^* = 2.44$

The fixed default restores the wall's positive a^* more faithfully; reference-guided global tuning improves full-image PSNR/SSIM/CIEDE2000 but weakens this local cue. Scene 08 is a development case, not a blind test.
